## PROFESSIONAL SUMMARY

Applied AI engineer who builds LLM products in Python and TypeScript and measures them with evals and cost controls. Founder of Shelfie, a vision-powered iOS kitchen app in closed beta. Previously five years as a Senior Data Analyst at Reshet 13, building the forecasting and ad-pricing models behind its programming and sales decisions.

## WORK EXPERIENCE

**Shelfie** 2025-present
Founder & Full-Stack AI Engineer · vision-powered kitchen platform for iOS, in closed beta New York

- Built the Swift app and its Postgres and TypeScript backend: a camera sweep builds a live kitchen inventory that drives expiry tracking, recipe matching, nutrition and grocery restocking.
- Ranked recipes availability-first, by what's on the shelf and expiring soon, to cut food waste and grocery spend.
- Made recognition learn from use: each household's corrections feed its priors and tune the auto-save confidence bar.
- Ran recognition on-device first, using cloud vision only when needed, at a calculated $0.002 to $0.003 per cloud call.
- Routed the app's cloud model calls through one gateway with spend limits and caching.
- Built evals for substitutions, food safety and scan replay; replay regressions fail scan PRs.

**Cohort NYC** 2026-present
Board Member & Head of Growth (volunteer) · NYC community nonprofit in formation, 1,800+ followers New York

- Built a growth system with agents that draft event copy, target distribution and analyze Postgres source data to build core audiences; followers grew 61% and attendance 55% in two months.

**Career break** · U.S. relocation and full-time AI/ML retraining 2023-2025

**Reshet 13** 2018-2023
Senior Data Analyst · Israeli TV network Tel Aviv

- Automated 70+ weekly Excel reports with Python and SQL pipelines adopted across the network and its news company, saving about 70 hours a week, and mentored four junior analysts through the rollout.
- Replaced legacy pricing heuristics with a regression model that found underpriced primetime ad slots; worked with the commercial team to take the new pricing model live in FY2022, when gross ad revenue finished 17% above FY2021.
- Built the audience analytics system, cleaning viewership data and replacing gut-based calls with a systematic workflow; developed the main forecasting model, the standard input for content acquisition and greenlight decisions.

## PROJECTS

**Open-source agent and eval tools**

- **rootcause:** Python agent that investigates incidents on a framework-free MCP tool loop, with an approval gate and OpenTelemetry traces. Over 300 graded runs on 25 incidents, worker agents cost about 3x per solved incident with no accuracy gain detected. In 525 more, no model acted on a planted prompt injection.
- **litmus:** mutation testing for agent evals that shows which prompt changes they miss and flags graders and LLM-judge rubrics that cannot fail. Showed 2 of 6 plugin evals stayed green with the plugin removed.
- **sous:** Claude Code harness that blocks destructive commands and secret reads and fails test runs that ran nothing.

## SKILLS

**AI engineering:** LLM agents and tool calling, multi-agent orchestration, LangGraph, evals and LLM-judge checks, prompt-injection testing, RAG, MCP, Claude Code plugins, hooks and guardrails, OpenTelemetry tracing
**Software:** Python, TypeScript, React, Next.js, Swift, SQL on Postgres and pgvector, CI and testing, Docker, Azure
**Data and ML:** regression and forecasting, data pipelines, pandas, scikit-learn, TensorFlow

## EDUCATION & CERTIFICATIONS

**B.Sc. Information Systems,** The Academic College of Tel Aviv-Yaffo 2014-2018
Certifications: MLOps & LLMOps Specializations, Duke (2025) · AI & ML Engineering, Microsoft (2025) · Agent Engineering Bootcamp, Break into Data (2025) · Deep Learning Specialization, DeepLearning.AI (2024)
